Field guide: LevelPenny

What each field means, how profit per hour is worked out, and a worked example. Fits one Letter page.

The fields

FIELD	WHAT TO ENTER
Price	What the customer pays you for the job, before any sales tax you collect for the state.
Materials	Every item: qty × unit cost, or one total. Include waste and extra trips to the supplier.
Crew labor	Each paid worker's wage × hours, plus labor burden for employees: payroll taxes, unemployment, workers' comp, benefits, per diem (example rates — check yours with your accountant). 1099 subs: no burden.
Your hours	All your time: quoting, buying, driving, working, invoicing. Not a cost — your pay comes out of profit.
Shipping	Delivery fees, freight, postage for this job.
Mileage	Total miles for all trips × cost per mile (fuel + wear; the IRS standard rate is a fair default).
Card fees	Processor % of the price + fixed fee per payment. Stripe 2.9% + 30¢, Square 2.6% + 15¢. Set payments to 2 for deposit + final.
Equipment, permits, subs, other	Rentals, dumpsters, permit fees, subcontractor bills, consumables — anything else this job costs.
Overhead	Your share of insurance, truck, phone, software, rent. As a % of price, or a flat amount.
Tax set-aside	% of profit to park for income tax. Only applied when the job makes a profit.

Tips

- Blank fields count as zero. Nothing is ever sent anywhere — data stays on your device.
- Use **Find my price** to quote: set a margin or profit-per-hour target and get the exact price.
- Save jobs and compare **profit per hour** to see which work actually pays. Free keeps 3 saved jobs; Pro and Business (see **Plans** in the app) are unlimited.

How the numbers are worked out

Direct costs = materials + crew labor + shipping + mileage + equipment + permits + subs + other
Card fees = price × fee% + fixed fee × payments
Total costs = direct costs + card fees + overhead
Gross profit = price − direct costs
Net profit = (price − total costs) − tax set-aside
Net margin = net profit ÷ price
Markup = (price − total costs) ÷ total costs
Profit per hour = net profit ÷ (crew hours + your hours)
  …or ÷ your hours only, with “My hours only”
Billed rate = price ÷ total hours
Break-even = lowest price where price − total costs ≥ 0
Find my price = lowest price where net margin or profit per hour meets your target

Worked example: deck repair

Price charged	$4,850.00
Materials (decking, joists, screws, hardware, stain)	−$1,069.43
Crew: 16 h × $32 + 16 h × $20, + 15.65% example burden ($130.21)	−$962.21
Delivery $75 + 84 mi × $0.70	−$133.80
Dumpster, permit, blades	−$345.00
Square fees: 2.6% + 15¢ × 2 payments	−$126.40
Overhead 10% of price	−$485.00
Profit before tax	$1,728.16
Tax set-aside 25%	−$432.04
Net profit (26.7% margin)	**$1,296.12**
Hours: crew 32 + you 10 = 42	÷ 42
Profit per hour, after everything	**$30.86/hr**

The price works out to $115.48 per hour worked — but after every cost you really keep $30.86. Per *your* hour it's $129.61.

Estimates only, based on the numbers you enter. Not financial or tax advice.
